NON-NATIVE PLANT INVASIVENESS RANKING FORM

ASSESSMENT FOR INVASIVE PLANTS NOT IN TRADE Form originally created for use in New York Indiana Form version date: November 1, 2010

^k Scientific name:	Dipsacus laciniatus L.	USDA Plants Code: DILA4
Common names:	Cut-Leaf Teasel	
Native distribution:	Temperate Eurasia	
Date assessed:	April 6, 2011	
Assessors:	Pia Marie Paulone and Ellen Jacquart	
Reviewers:	John Drake and Ted Anchor	
Date Approved:	September 21, 2012	

Indiana Invasiveness Rank: High (Relative Maximum Score 70.00-80.00)

Inv	asiveness Ranking Summary	Total (Total Answered*)	Total
(see details under appropriate sub-section)		Possible	
1	Ecological impact	40 (<u>30</u>)	20
2	Biological characteristic and dispersal ability	25 (<u>25</u>)	19
3	Ecological amplitude and distribution	25 (<u>25</u>)	22
4	Difficulty of control	10 (10)	7
	Outcome score	100 (<u>90</u>) ^b	68 ^a
	Relative maximum score [†]		75.55
Indiana Invasiveness Rank [§]		High (Relative Maximum	Score 70.00-80.00)

* For questions answered "unknown" do not include point value in "Total Answered Points Possible." If "Total Answered Points Possible" is less than 70.00 points, then the overall invasive rank should be listed as "Unknown." †Calculated as 100(a/b) to two decimal places.

§Very High >80.00; High 70.00-80.00; Moderate 50.00-69.99; Low 40.00-49.99; Insignificant <40.00

ASSESSMENT FOR INVASIVE PLANTS NOT IN TRADE Form originally created for use in New York Indiana Form version date: November 1, 2010

Documentation:

Sources of information: Range maps compiled from PLANTS database, http://plants.usda.gov/java/; Indiana CAPS database, http://extension.entm.purdue.edu/CAPS/index.html; Indiana IPSAWG reports (unpublished); and EDDMapS reports, http://eddmaps.org/

A3 Describe the potential or known suitable habitats within Indiana (underlined). Natural habitats include all habitats not under active human management. Managed habitats are indicated with an asterisk.

Aquatic Habitats	Wetland Habitats	Upland Habitats
Rivers/streams	Marshes	<u>Forest</u>
Natural lakes and ponds	Fens	<u>Savannas</u>
Reservoirs/impoundments*	Bogs	Barrens
	Shrub swamps	Prairies
	Forested wetlands/riparian	Cultivated*
	Beaches/dunes	Old Fields*
	Ditches*	Roadsides *

Other potential or known suitable habitats within Indiana:

No additional habitats. Documentation: Sources of information: Brooklyn Botanic Garden, 2009, Jacquart and Anchor personal observation.

B. INVASIVENESS RANKING

Questions apply to areas similar in climate and habitats to Indiana unless specified otherwise.

1. ECOLOGICAL IMPACT

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

A.	No perceivable impact on ecosystem processes based on research studies, or the absence of	0
	impact information if a species is widespread (>10 occurrences in minimally managed	
	northeast for >100 years.	
В.	Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)	3
C.	Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)	7
D.	Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native	10

- plants or more likely to favor non-native species)
- U. Unknown

Sco	ore	U
Documentation:		
Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the		
absence of impact information)		
While the plant has been known in the U.S. since the 1800s, specific studies on its impacts	5	
to ecosystem processes and system wide parameters are not known

NON-NATIVE PLANT INVASIVENESS RANKING FORM

ASSESSMENT FOR INVASIVE PLANTS NOT IN TRADE Form originally created for use in New York Indiana Form version date: November 1, 2010

	Score	1
	Documentation:	
	Describe vegetative response:	
	Regrowth from basal rosettes.	
	Sources of information:	
	Grauver, 2006; Jacquart pers. obs.	
4.3. Lev	vel of effort required	
А.	Management is not required: e.g., species does not persist without repeated anthropogenic disturbance.	0
В.	Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 fr^2)	2
C.	Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication is difficult, but possible (infectation as above)	3
D.	Management requires a major investment: e.g. more than 100 person-hours/year of manual effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above).	4
U.	Unknown	
	Score	4
	Identify types of control methods and time-term required: The following is from Gruver (2006): "The Invasive Plant Association of Wisconsin (IPAW) regards this species as relatively difficult to control (IPAW 2003). Mechanical control is recommended in natural areas. In small stands, rosettes can be dug up, although plants often resprout if the root is not completely removed and damage to the surrounding area can occur if plants are large. Stalks can also be cut once flowering has begun, but before seed set. Because seeds can develop on immature heads, however, the cut stalks need to be removed from the area. Also, cutting of flowering stems may need to be repeated for several years to achieve effective control. Mowing is not an effective control, and in fact often increases the size of patches (Parrish et al. 2005). If mechanical control is not feasible, foliar application of herbicides can be used. Because rosettes of this species are green in early spring and late fall when many native plants are dormant, herbicide control during these times will minimize damage to native species. Also, dict-selective herbicides (e.g. Triclopyr) are effective, which reduces damage to native monocots. As with mechanical control, however, herbicide applications over several years are required to manage an established population. Periodic prescribed burning may be helpful in conjunction with mechanical and/or chemical control (Glass 1990, Weber 2003, Smith 2004, WIDNR 2004, Czarapata 2005). No biocontrol agents are currently in use, but these are being researched (Rector et al. 2006). "Several years (up to 5-6) of treatment may be necessary to totally eradicate this species from a natural community, regardless of whether mechanical or chemical treatment is chosen (Glass 1990, Gremaud and Smith 2002, Smith 2004, WIDNR 2004, Czarapata 2005).	
	"If rosettes are dug up, damage to the surrounding area can occur if plants are large. If flowering stems are cut, native species of similar height may also be cut in the process. If herbicides are used, non-target damage may occur, though this can be minimized by spraying during the dormant season and/or using a dicot-specific herbicide (Glass 1990, Weber 2003, Smith 2004, WIDNR 2004, Czarapata 2005)."

Citation: This IN ranking form may be cited as: Jacquart, E.M. 2012. Invasiveness ranking system for non-native plants of Indiana. Unpublished. Invasive Plant Advisory Committee (IPAC) to the Indiana Invasive Species Council, Indianapolis, IN.

Acknowledgments: The IN ranking form is an adaptation for Indiana use of the form created for New York by Jordan et al. (2009), cited below. Documentation for species assessed for New York are used for Indiana where they are applicable. The Invasive Plant Advisory Committee was created by the Indiana Invasive Species Council in October 2010, and is made up of the original members of the Indiana Invasive Plant Assessment Working Group (IPSAWG). Original members of IPSAWG included representatives of the The Nature Conservancy; Indiana Native Plant and Wildflower Society; Indiana Nursery and Landscape Association; Indiana Chapter of the American Society of Landscape Architects; Indiana Forage Council; Indiana Wildlife Federation; Indiana State Beekeepers Association; Indiana Beekeeper's Association; Department of Natural Resources; Hoosier National Forest; Indiana Academy of Science; Natural Resources Conservation Service; Indiana Department of Transportation; Purdue Cooperative Extension Service; Seed Administrator, Office of the Indiana State Chemist.
