Assessment of Invasive Species in Indiana’s Natural Areas

***OFFICIAL Mimosa (Albizia julibrissin) ASSESSMENT***

Answers are highlighted in yellow, comments are inserted in italics

Last assessed by Will Drews 10/29/2019, reviewed and approved by IPAC 12/6/2019

**Medium**

Rankings: Low < 45, Medium 45 – 80, High > 80

Contents of the Assessment:
Section I – Invasion Status. Determines whether the species being evaluated is invasive in Indiana.
Section II – Ecological Impacts of Invasion. Evaluates the significance of impacts of the species.
Section III – Potential for Expansion. Evaluates the actual and/or potential expansion of the species.
Section IV – Difficulty of Management. Evaluates how hard it is to control the invasive species.
Section V – Commercial Value. Evaluates how valuable the species is economically in Indiana.

Questions in Sections I – V may direct you to one or more of the following sections for particular invasive species:
Section A. For species which have impacts limited to a few sites, assesses the potential for further spread.
Section B. For species which have medium impacts but high value, assesses whether species could be used in specific circumstances that would prevent escape and invasion.

A worksheet for use with the assessment is found on page 8.

Automatic Exemption From the Assessment

Is this species listed on any federal or on an Indiana state noxious, or prohibited plant lists?
   If YES then do not proceed with assessment but indicate a conclusion of
   Do not use this plant on the front of the response form.
   If NO then go to Section I.

Section I Invasion Status

1-a Current Invasion in Indiana

1. Does this species occur in any natural areas in Indiana?
   If NO then go to Section III-c.
   If YES then go to 1-a 2.
2. Does it ONLY occur in natural areas of Indiana because it has persisted from its previous cultivation (e.g., in abandoned farmland or homesteads)?
   If YES then go to Section III-c.
   If NO then go to Section 1-b (below).

1-b Invasion Status in Indiana
Evidence of invasion (forming self-sustaining and expanding populations within a plant community with which it had not previously been associated) must be provided. If not available in a published, quantitative form, this evidence must include written observations from at least three appropriate biologists.

1. Is species invasive ONLY when natural disturbance regime and scale have been altered? (e.g. where frequency, extent, or severity of fires have been reduced by human activity).
   - If **YES** then go to questions 1-b 2.
   - If **NO** – the species is invasive, go to Section II (below).

2. Has this species ever been known to persist, following colonization, when the natural regime is resumed and the natural flora/communities recover? (e.g., is not an early successional species that only temporarily invades disturbed sites.)
   - If **YES** (or unknown) - the species is invasive, go to Section II (below).
   - If **NO** (known not to persist) the species is currently not invasive in Indiana. Go to Section III-c (page 4) to assess the species’ potential for future invasion.

---

### Section II  
Ecological Impacts of Invasion Impact Index

#### II-a  
Known Impacts at WORST SITE(S) (without, or before, any control effort)

Add up points for ALL impact statements (i through vi) that are true at the worst affected site(s) then go to question II-b. Evidence of impacts must be provided. If not available in published, quantitative form, this evidence must include written observations from at least three appropriate biologists, including specific locations of observations. Scientific names of impacted species (e.g., State-listed or native species with which hybridization occurs) must be included on the response form. If there is no evidence of an impact, then assign 0 points unless the impact is considered very likely (e.g., fixes N₂ in low nutrient soil that can change the flora) or the impact (except vi) has been demonstrated in similar habitats in states. In these cases assign 0.5 points.

<table>
<thead>
<tr>
<th>Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>i) Causes long-term, broad alterations in ecosystem processes changing the community as a whole (e.g. invasion of cattails changes hydrology, drying the site and allowing open aquatic systems to become forested).</td>
</tr>
<tr>
<td>15</td>
</tr>
<tr>
<td><strong>fixes N₂ in low nutrient soil that can change the flora</strong></td>
</tr>
<tr>
<td>ii) Has negatively impacted Indiana State-listed or Federal-listed plants or animals (choose one of the following):</td>
</tr>
<tr>
<td>Displacement, death or hybridization has been documented AND occurs in at least 20% of known locations of the listed species, OR these effects occur in less than 20% of known locations of the listed species, but at least 4 different listed species are affected.</td>
</tr>
<tr>
<td>12</td>
</tr>
</tbody>
</table>
Displacement, death or hybridization occurs in less than 20% of locations of the listed species OR impacts are considered likely because the listed and invasive species closely co-habit (e.g., compete for light).

*Known to invade barrens and glades in Harrison County which contain state listed like Asclepias virdis, Muhlenbergia capillaris, Polygala incarnata, among others (Slack, Jacquart Personal Observation)*

iii) Displaces or precludes native vegetation (affecting mortality and/or recruitment) by achieving infestations in the state that have at least 50% coverage of this species (as defined in the glossary) in the affected stratum that meet any of the following criteria:
   a) collectively add up to at least 10 acres
   b) are 5 infestations of at least 0.25 acres
   c) are 5 infestations that cover an entire localized community (e.g. sinkhole, seeps, fens, bogs, barrens, cliffs)
   d) are 5 infestations some of which are at least 0.25 acres and others of which cover entire localized communities.

*Over 20 ac. recorded on EDDMapS, multiple over 0.25 ac.*

iv) Changes community structure in ways other than vegetation displacement (e.g., alters wildlife abundance, adds a new stratum, or increases stem density within a stratum by more than 5-fold).

*Adds a new stratum to prairie and other open type habitats. Can create very dense patches after fire or mowing, techniques that are used to manage these areas. Illinois botanists worried about it increasing in their prairies and glades. (McCain 2012, Meyer 2010)*

v) Hybridizes with native Indiana plants or commercially-available species.

vi) Covers over 15% of invaded stratum (but if 12 points were assigned for statement iii, do not assign points here) on > 10 acres in the state.

*Total points (place in worksheet page 8):*

**II-b Range of Habitats in Which Species is Invasive**

**Forest:**
- 1) Dry upland
- 2) Dry-mesic upland
- 3) Mesic upland
- 4) Mesic floodplain
- 5) Wet-mesic floodplain
- 6) Wet floodplain
- 7) Bluegrass till plain flatwoods*
- 8) Boreal flatwoods*
- 9) Central till plain flatwoods
- 10) Dry flatwoods*
- 11) Sand flatwoods*
- 12) Southwestern lowland mesic flatwoods*

**Savanna:**
- 13) Mesic savanna*
- 14) Dry sand savanna*
- 15) Dry-mesic sand savanna*

**Barrens:**
- 16) Limestone bedrock*
- 17) Sandstone bedrock*
- 18) Siltstone bedrock*
- 19) Chert*
- 20) Gravel*
- 21) Sand*
- 22) Clay*

**Prairie:**
- 23) Dry-mesic prairie*
- 24) Mesic prairie*
- 25) Wet prairie*
- 26) Dry sand prairie*
- 27) Dry-mesic sand prairie*
- 28) Wet-mesic sand prairie*
- 29) Wet sand prairie*

**Wetland:**
- 30) Marl beach*
- 31) Acid bog*
- 32) Circumneutral bog*
- 33) Fen*
- 34) Forested fen*
- 35) Muck and Sand flats*
- 36) Marsh*
- 37) Sedge meadow*
- 38) Panne*
- 39) Acid seep*
- 40) Calcareous seep*
- 41) Circumneutral seep*
- 42) Forest swamp
- 43) Shrub swamp

**Lake:**
- 44) Lake
- 45) Pond

**Stream:**
- 46) Low-gradient creek
- 47) Medium-gradient creek
- 48) High-gradient creek
- 49) Low-gradient river
- 50) Medium-gradient river
- 51) Major river

**Primary:**
- 52) Aquatic cave*
- 53) Terrestrial cave*
- 54) Eroding cliff*
- 55) Limestone cliff*
- 56) Overhang
Is this species known to be invasive in at least four habitat-types (note – rare habitat-types are marked with a * and count as 2 when adding) OR does it occur in at least one habitat-type of each of the terrestrial and palustrine/aquatic lists (palustrine/aquatic habitats are shown in bold)

If **YES** then multiply total score from II-a by 1.5
then go to Section II-c (Below)
If **NO** then multiply total score from II-a by 1
then go to Section II-c (Below)
Place point total in worksheet, page 8

**II-c Proportion of Invaded Sites with Significant Impacts**

Of the invaded sites, might any of the worst impacts [items i-v in section II-a] only occur under a few, identifiable, environmental conditions (i.e., edaphic or other biological conditions occurring in 1-10% of the sites)? Documentation of evidence must be provided for a **YES** answer.

If **NO** or **NO SCORE** on items i to v in section II-a
then go to Section III
If **YES** then go to Section A

<table>
<thead>
<tr>
<th>Section III</th>
<th>Potential for Expansion</th>
<th>Potential Index</th>
</tr>
</thead>
</table>

This section evaluates a species’ actual and/or potential for expansion in Indiana.

**III-a Potential for Becoming Invasive in Indiana**

1. Is information available on the occurrence of new populations of this species in Indiana over the last 5 years?
   If **YES** then go to section III-b
   If **NO** go to Section III-c to estimate potential for expansion based on the biology of the species.

**III-b Known Rate of Invasion.**

1. Was this species reported in more than two new discrete sites (e.g., lakes, parks, fragments of habitats at least 5 miles apart) in any 12 month period within the last 5 years?
   If **NO** then P = Low; then go to Section IV
   If **YES** then P = High; then go to Section IV

**III-c Estimated Rate of Invasion.** This section is used to predict the risk of invasion for species that are 1) not currently invasive in the state, and 2) invasive in the state but for which no data on current rate of spread exists. These questions are based on Hiebert et al. 1995.

1. Does this species hybridize with any State-listed plants or commercially-important species? (E.g., exhibit pollen / genetic invasion.)
   If **YES** then go to Section B
   If **NO** then go to question III-c 2.

2. Add up all points from statements that are true for this species.

   Points

   i. Ability to complete reproductive cycle in area of concern
      a. not observed to complete reproductive cycle 0
      b. observed to complete reproductive cycle 5
Silktree sexually reproduces by seed production and vegetatively by sprouting from roots. It grows quickly in favorable site conditions. (Meyer 2010)

ii. Mode of reproduction

a. reproduces almost entirely by vegetative means 1
b. reproduces only by seeds 3
c. reproduces vegetatively and by seed 5

Silktree sexually reproduces by seed production and vegetatively by sprouting from roots (Meyer 2010)

iii. Vegetative reproduction

a. no vegetative reproduction 0
b. vegetative reproduction rate maintains population 1
c. vegetative reproduction rate results in moderate increase in population size 3
d. vegetative reproduction rate results in rapid increase in population size 5

Vegetative reproduction mostly maintains or slightly increases population after aboveground disturbance (Drews, personal observation; Meyer 2010)

iv. Frequency of sexual reproduction for mature plant

a. almost never reproduces sexually in area 0
b. once every five or more years 1
c. every other year 3
d. one or more times a year 5

Reproduces at an early age and can produce 8,000 seeds/year (Meyer 2010)

v. Number of seeds per plant

a. few (0-10) 1
b. moderate (11-1,000) 3
c. many-seeded (> 1,000) 5

Reproduces at an early age and can produce 8,000 seeds/year (Meyer 2010)

vi. Dispersal ability

a. little potential for long-distance dispersal 0
b. great potential for long-distance dispersal 5

Seeds are primarily dispersed by falling (gravity) but can be dispersed also by wind, water, and animals. Under moderate to high wind conditions, seeds can disperse at least 300 ft. away from trees, potentially further. Animals and water can also spread seeds long distances. (Meyer 2010)

vii. Germination requirements

a. requires open soil and disturbance to germinate 0
b. can germinate in vegetated areas but in a narrow range or in special conditions 3
c. can germinate in existing vegetation in a wide range of conditions 5

Can survive and thrive in vegetated areas but generally after disturbances. (Drews, personal observation; McClain 2012, Meyer 2010)

viii. Competitive ability

a. poor competitor for limiting factors 0
b. moderately competitive for limiting factors 3
c. highly competitive for limiting factors 5

Grows under a wide variety of environmental conditions, low to high moisture content, poor to fertile soils, etc. Nitrogen fixing capability allows it to grow on poor soils. (Meyer 2010)

Pennsylvania DCNR labels Mimosa as “highly competitive in disturbed areas”

Total points for questions i – viii (place in worksheet page 8): 34
### Section IV  Difficulty of Management

Add up all points from statements that are true for this species then go to Section V. Assign 0.5 point for each statement for which a true/false response is not known.

</tbody>
</table>

**Section A (from Section II-c)**

A1 Can the habitats in which the worst-case ecological impacts occur (items i to v in Section II-a) be clearly defined as different from invaded sites where there are no such impacts (e.g., defined by edaphic or biological factors)? (If ecological impacts include negative effects on a State-listed species, then the specific habitats in which that State-listed species occurs must be clearly distinguishable from habitats in which it does not occur.)

If NO then return to Section III
If YES then Go to question A2 and prepare such a site definition

A2 Can an estimate be made of the maximum distance that propagules (or pollen if hybridization is a
concern) might reasonably be expected to disperse?

If NO then return to Section III
If YES then prepare instructions for Specified and Limited Use based on maximum dispersal distance (e.g., may be acceptable for use in specific areas but not near habitats where impacts are high.) Reassess if the incidence of worst-case impacts increases above 10% or within 10 years, whichever is earlier. THEN resume the assessment at Section III to provide scores for the other indices.

Section B (from Section III-c or if Value = High and Impact = Medium)

B1 Are there specific circumstances in which this species could be used that would not be expected to result in escape and invasion? (E.g., foliage plants that are only used indoors and which can be reasonably prevented, by conspicuous labeling, from use or disposal in the landscape.)

If NO, then retain the previously derived Conclusion.
If YES, then Acceptable for Specified and Limited Use where regulations and educational programs for penalties and enforcement of misuse exist. Reassess this species every 2 years.

Worksheet for Assessment

Section I:
Follow directions to different sections.

Section II:
Impacts Point Total: ___20__ X (1 or \[\text{1.5}\]) = ___30___ Impacts

Section III:
Potential = High Medium or Low ___34___ Potential for Expansion

Section IV:
Difficulty of Management Point Total: ___15___ Difficulty of Management

Section V:
Commercial Value Point Total: ___10___ Value

Total Score is Impacts + Potential for Expansion + Difficulty of Management = ___79___
