* For questions answered “unknown” do not include point value in “Total Answered Points Possible.” If “Total Answered Points Possible” is less than 70.00 points, then the overall invasive rank should be listed as “Unknown.”
\(^\dagger\) Calculated as 100(a/b) to two decimal places.
\(^\$\) Very High >80.00; High 70.00–80.00; Moderate 50.00–69.99; Low 40.00–49.99; Insignificant <40.00

A. DISTRIBUTION (KNOWN/POTENTIAL):

A1.1. Has this species been documented to persist without cultivation in IN? (reliable source; voucher not required)

- Yes – continue to A2.2
- No – continue to A2.1

A2.1. What is the likelihood that this species will occur and persist outside of cultivation given the climate in Indiana? (obtain from occurrence data in other states with similar climates)

- Likely – continue to A2.2
- Not likely
**INDIANA**

**NON-NATIVE PLANT INVASIVENESS RANKING FORM**

**ASSESSMENT FOR INVASIVE PLANTS NOT IN TRADE**

Form version date: August 12, 2008

---

---

*If the species does not occur and is not likely to occur in Indiana, then stop here as there is no need to assess the species.*

A2.2. Describe the potential or known suitable habitats within Indiana (underlined). Natural habitats include all habitats not under active human management. Managed habitats are indicated with an asterisk.

**B. INVASIVENESS RANKING**

1. **ECOLOGICAL IMPACT**

1.1. Impact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire regime, geomorphological changes (erosion, sedimentation rates), hydrologic regime, nutrient and mineral dynamics, light availability, salinity, pH)

A. No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.  

B. Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)  

C. Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)  

D. Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)  

U. Unknown  

---

**Documentation:**
Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the absence of impact information)
Species has been present in U.S. since 1700s and no perceivable impact on ecosystem processes have been reported. However, no literature can be cited that directly addresses the issue of M. alba's impacts on ecosystem processes; fewer than 10 publications that address this plant.

---

Score U
1.2. Impact on Natural Community Structure
   A. No perceived impact; establishes in an existing layer without influencing its structure 0
   B. Influences structure in one layer (e.g., changes the density of one layer) 3
   C. Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer) 7
   D. Major alteration of structure (e.g., covers canopy, eradicating most or all layers below) 10
   U. Unknown

   Score 3

   Documentation:
   Identify type of impact or alteration:
   Occasionally dense stands are observed clearly, therefore, impacting the density of one layer.
   Sources of information:

1.3. Impact on Natural Community Composition
   A. No perceived impact; causes no apparent change in native populations 0
   B. Influences community composition (e.g., reduces the number of individuals in one or more native species in the community) 3
   C. Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community) 7
   D. Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards species exotic to the natural community) 10
   U. Unknown

   Score 3

   Documentation:
   Identify type of impact or alteration:
   When stands are dense they can reduce native forest regeneration.
   Sources of information:

1.4. Impact on other species or species groups (cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades. Examples include reduction in nesting/foraging sites; reduction in habitat connectivity; injurious components such as spines, thorns, burrs, toxins; suppresses soil/sediment microflora; interferes with native pollinators and/or pollination of a native species; hybridizes with a native species; hosts a non-native disease which impacts a native species)
   A. Negligible perceived impact 0
   B. Minor impact 3
   C. Moderate impact 7
   D. Severe impact on other species or species groups 10
   U. Unknown

   Score 10

   Documentation:
   Identify type of impact or alteration:
   The species carries a variety of fungal root diseases that can kill the native Morus rubra; it can also hybridize with the M. rubra threatening the native species, which does appear to be
in decline at least in lower New York <see map at http://nymf.bbg.org/profile_map.asp?id=409>.
Sources of information:

Total Possible 30
Section One Total 16

2. BIOLOGICAL CHARACTERISTICS AND DISPERSAL ABILITY

2.1. Mode and rate of reproduction (provisional thresholds, more investigation needed)

A. No reproduction by seeds or vegetative propagules (i.e. plant sterile with no sexual or asexual reproduction).
   Score 0

B. Limited reproduction (fewer than 10 viable seeds per plant AND no vegetative reproduction; if viability is not known, then maximum seed production is less than 100 seeds per plant and no vegetative reproduction)
   Score 1

C. Moderate reproduction (fewer than 100 viable seeds per plant - if viability is not known, then maximum seed production is less than 1000 seeds per plant - OR limited successful vegetative spread documented)
   Score 2

D. Abundant reproduction with vegetative asexual spread documented as one of the plants prime reproductive means OR more than 100 viable seeds per plant (if viability is not known, then maximum seed production reported to be greater than 1000 seeds per plant.)
   Score 4

U. Unknown
   Score 4

Documentation:
Describe key reproductive characteristics (including seeds per plant):
Reproduction is by seed and a single plant can produce copious fruit with 1000s seed per individual.
Sources of information:
Schaffner, 1936; Czarapata, 2005; Cordeiro & Fellows, 2006; authors’ personal observations.

2.2. Innate potential for long-distance dispersal (e.g. bird dispersal, sticks to animal hair, buoyant fruits, pappus for wind-dispersal)

A. Does not occur (no long-distance dispersal mechanisms)
   Score 0

B. Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations)
   Score 1

C. Moderate opportunities for long-distance dispersal (adaptations exist for long-distance dispersal, but studies report that 95% of seeds land within 100 meters of the parent plant)
   Score 2

D. Numerous opportunities for long-distance dispersal (adaptations exist for long-distance dispersal and evidence that many seeds disperse greater than 100 meters from the parent plant)
   Score 4

U. Unknown
   Score 4

Documentation:
Identify dispersal mechanisms:
Fruit are readily eaten by birds and other small animals.
Sources of information:
Weeks, 2003; authors' personal observations.

2.3. Potential to be spread by human activities (both directly and indirectly – possible mechanisms include: commercial sales, use as forage/revegetation, spread along highways, transport on boats, contaminated compost, land and vegetation
management equipment such as mowers and excavators, etc.)

A. Does not occur 0
B. Low (human dispersal to new areas occurs almost exclusively by direct means and is infrequent or inefficient) 1
C. Moderate (human dispersal to new areas occurs by direct and indirect means to a moderate extent) 2
D. High (opportunities for human dispersal to new areas by direct and indirect means are numerous, frequent, and successful) 3
U. Unknown

Documentation:
Identify dispersal mechanisms:
Many varieties are cultivated originally for silk production as well as food, and ornament; a weeping cultivar is sold.
Sources of information:

2.4. Characteristics that increase competitive advantage, such as shade tolerance, ability to grow on infertile soils, perennial habit, fast growth, nitrogen fixation, allelopathy, etc.

A. Possesses no characteristics that increase competitive advantage 0
B. Possesses one characteristic that increases competitive advantage 3
C. Possesses two or more characteristics that increase competitive advantage 6
U. Unknown

Documentation:
Evidence of competitive ability:
Perennial, grows on infertile soils.
Sources of information:
Weeks, 2003; Cordeiro & Fellows, 2006; authors’ personal observations.

2.5. Growth vigor

A. Does not form thickets or have a climbing or smothering growth habit 0
B. Has climbing or smothering growth habit, forms a dense layer above shorter vegetation, forms dense thickets, or forms a dense floating mat in aquatic systems where it smothers other vegetation or organisms 2
U. Unknown

Documentation:
Describe growth form:
Does not form thickets.
Sources of information:
Cordeiro & Fellows, 2006; authors’ personal observations.

2.6. Germination/Regeneration

A. Requires open soil or water and disturbance for seed germination, or regeneration from vegetative propagules. 0
B. Can germinate/regenerate in vegetated areas but in a narrow range or in special conditions 2
C. Can germinate/regenerate in existing vegetation in a wide range of conditions 3
U. Unknown (No studies have been completed) U

3.6. Current introduced distribution of the species in natural areas in Indiana
A. Present in no Indiana counties 0
B. Present in 1-10 Indiana counties 1
C. Present in 11-20 Indiana counties 2
D. Present in 21-50 Indiana counties 3
E. Present in more than 50 Indiana counties or on Federal noxious weed list 4
U. Unknown

Score 4

Documentation:
Describe distribution:
See A1.1.
Sources of information:
Weldy and Werier, 2005.

4. FEASIBILITY OF CONTROL
4.1. Seed banks
A. Seeds (or vegetative propagules) remain viable in soil for less than 1 year, or does not make viable seeds or persistent propagules. 0
B. Seeds (or vegetative propagules) remain viable in soil for at least 1 to 10 years 2
C. Seeds (or vegetative propagules) remain viable in soil for more than 10 years 3
U. Unknown

Score 2

Documentation:
Identify longevity of seed bank:
Seeds may take over 12 months to germinate indicating they remain viable for over a year; evidence not available that they remain viable for 10 years or more.
Sources of information:
Plants for a Future, 2008.

4.2. Vegetative regeneration
A. No regrowth following removal of aboveground growth 0
B. Regrowth from ground-level meristems 1
C. Regrowth from extensive underground system 2
D. Any plant part is a viable propagule 3
U. Unknown

Score 1

Documentation:
Describe vegetative response:
Plants can respy after being cut; can also sucker.
Sources of information:
Cordeiro & Fellows, 2006; author’s (Moore’s) personal observations.
4.3. Level of effort required

A. Management is not required: e.g., species does not persist without repeated anthropogenic disturbance. 0

B. Management is relatively easy and inexpensive: e.g. 10 or fewer person-hours of manual effort (pulling, cutting and/or digging) can eradicate a 1 acre infestation in 1 year (infestation averages 50% cover or 1 plant/100 ft²). 2

C. Management requires a major short-term investment: e.g. 100 or fewer person-hours/year of manual effort, or up to 10 person-hours/year using mechanical equipment (chain saws, mowers, etc.) for 2-5 years to suppress a 1 acre infestation. Eradication may be difficult, but possible (infestation as above). 3

D. Management requires a major investment: e.g. more than 100 person-hours/year of manual effort, or more than 10 person hours/year using mechanical equipment, or the use of herbicide, grazing animals, fire, etc. for more than 5 years to suppress a 1 acre infestation. Eradication may be impossible (infestation as above). 4

U. Unknown

Documentation:
Identify types of control methods and time-term required:
Hand pulling or digging for smaller plants, girdling and chemical treatment for larger plants. Stems can resprout if not disposed.
